Caliber

CAL HACKS 13.0 · AUTONOMOUS ACCOUNTS PAYABLE FOR TRUCKING
DEMO COMPANY IS SIMULATED · NO REAL MONEY MOVES

An AI bookkeeper for trucking fleets that can't touch the money.

Trucking companies pay hundreds of fuel, toll and repair bills a day, checked by hand. **Caliber checks every bill, pays the normal ones, investigates the odd ones, and asks you about anything unusual.**

IN PLAIN ENGLISH

Imagine a new bookkeeper who checks every receipt and asks you about anything odd, **but was never given the keys to the bank account.** That's Caliber.

AP clerk (accounts payable): the person who pays a company's bills. **Hold**: a bill paused for a closer look. **Rule**: an answer it remembers.

THE STORY OF ONE BILL

EACH STEP: PLAIN WORDS FIRST, THE TECHNOLOGY UNDERNEATH

01
A $412 fuel bill arrives
Truck 17's fuel card buys 120 gallons in Schulenburg, Texas.

Data in: fuel, toll and invoice files; 7,944 bills, 92 days

02
Code checks it and stops it
Truck 17's GPS says it was **parked 97 miles away**, engine off. The payment is held.

Kernel: plain code in whole cents, inside SpacetimeDB

03
AI investigates why
It finds **truck 22** at the pump and a log entry: the driver had swapped trucks.

Factory Droid, read-only, searching **Elastic** over MCP

04
You answer one question
"Did Ortiz drive truck 22?" You say yes. It's paid, and it **remembers**.

Fetch.ai agent on ASI:One; **Nessie** bank records it

WHY YOU CAN TRUST IT

EVERY NUMBER IS COMPUTED BY A SCRIPT, NOT TYPED

0

The AI can't pay. Ever.
If the AI tries to approve a payment, the database refuses and logs it. No one can approve their own request.

Segregation of duties as role checks in SpacetimeDB reducers

52 / 52

It proves it's accurate.
We hid 52 mistakes and 6 innocent look-alikes in 7,944 bills. It caught all 52, held no normal bill, and cleared each look-alike with one question.

Precision 1.00 · recall 1.00 on a hidden answer key no agent can read

1 answer

It learns only from you.
Your answer becomes a narrow rule with an expiry date, tested on past bills first. Rules that would excuse a real problem are refused.

Scoped, expiring, backtested rules; 0 planted errors ever cleared by one

WHAT IT CATCHES

	PLANTED / CAUGHT
The truck wasn't where its fuel card was used	20 / 20
A toll charged twice within minutes	11 / 11
A repair price above the signed contract (5%+)	9 / 9
More fuel than the truck's tank can hold	6 / 6
Billed for parts that never arrived	5 / 5
The same invoice sent twice	4 / 4
Vendor switched bank accounts right before a big bill	3 / 3

WHY NOT JUST ASK AN AI?

SAME 558 BILLS

WHO DECIDES	PRECISION	COST
Caliber's code	1.00	$0
Claude Sonnet 5.5	1.00	$6.38
Claude Opus 5.5	0.81	$12.85
asi1-mini	0.31	n/a

One AI matched us; others held good bills by mistake. **Code gives the same answer every time, for free**, so AI only does what code can't: read evidence and ask you.

WHO DOES WHAT

EACH SPONSOR TOOL HAS EXACTLY ONE JOB

SpacetimeDB
The vault: holds everything, blocks the AI from paying.

Factory Droid
The detective: reads evidence, never writes.

Elastic
The search: "which truck was at this pump?"

Fetch.ai
The chat: you approve from ASI:One.

CRS
Vendor background check (sample data today).

Capital One Nessie
Practice bank: each payment gets a receipt id.

Microsoft
Real customer, measured results, honest limits.

Hyphenate
AI does the clerk's job; you keep the boss's.

caliber.compare
Website, 4-page technical paper and the list of what we didn't build.
Try it on ASI:One: `@caliber-investigator why 2231`
